Every Optical Item Offered On These Pages Has Met Gander Mountain's Rigorous Standards Of Performance

California Style

American Mon-a-block Style

Herter's Binocular terms and the meaning of their numbers:

For example: A 7x50 binocular is a 7 power unit with a 50mm objective lens. The 7 power optical system actually magnifies the image you are viewing, regardless of distance, to 7 times its actual size. The size of the objective lens in relation to the power and ocular lens has a direct bearing on the size of the field of view. The selection available in our Hudson Bay binoculars offers a size to fit your every need.

**LIGHT TRANSMISSION:** There has been considerable controversy over the years as to the efficiency of optical equipment regarding light transmission. The greatest improvement during the past century on optical equipment evolved from the experiments of World War II. This mainly was the development of a hard chemical coating which is applied to all glass to air surfaces of all optical elements used in the manufacture of Hudson Bay binoculars and monoculars. This chemical namely magnesium fluoride is deposited under extreme high vacuum by molecular bombardment. This film coating must be only one quarter of a wave length of light in thickness which is approximately six millionths of an inch. It is readily understandable then that to advertise merely coated optics means absolutely nothing. "Double" coated optics is also merely another advertising hoax, as nothing could be further from the truth. Herter's Hudson Bay binoculars' and monoculars' optical elements are manufactured only to the most rigid requirements using only the most modern equipment. The percentage of transmitted light listed under each individual binocular and monocular greatly exceeds the amount of normal day light the human eye can utilize under any condition, however the brilliance and contrast of the view is greatly increased light transmission in times of poor light. **EYE CUPS:** The use of special eye cups either retractable or detachable for eye glass wearers greatly reduces the field of vision. For the proper use of binoculars and monoculars eye glasses should be removed. The optics in these units will correct all eye defects except in rare acute astigmatism. If the full field of view is not required or desired eye glasses may be worn at any time.

**PRISMS:** There are four prisms in each binocular, two for each body housing and optical system. The prisms are cut from blocks of the highest quality barium crown optical glass then precision ground and polished with minute precision. The prisms only reflect or transmit the image from the objective lens through the ocular lens and have nothing to do with the degree of magnification. Without the use of prisms compact manufacture of binoculars would not be possible as an entirely different optical system would be necessary such as used in a telescope.

Two types of prisms are available in modern binoculars namely BK7 and BAK4. Contrary to competitive advertising the prisms are basically identical in manufacture the only difference being in the percentage of light transmission. The BAK4 prisms will transmit 10% more light in normal daylight. This we don't need for daylight viewing so it is actually wasted. The one advantage of the BAK4 prisms however is important for those who desire it. In times of very poor light only at early dawn, late evening or in darkened hours the BAK4 prisms will transmit 20% to 40% more light than the BK7 prisms, depending upon the degree of light available. This can be a necessary advantage for the hunter or anyone using binoculars during these hours.

**BODY STYLES:** This in general is not at all a matter of personal preference but of engineering to fulfill a definite purpose. The Mon-a-block American design has an advantage of being a one piece housing. Such a binocular is somewhat more dust and moisture proof. It requires additional intricate machining and assembly time and therefore is some what higher in price. It is by far the most popular of all body designs. The German style two piece housing represents the budget type glass which still demands high praise as to design. Herter's Hudson Bay German designs are optically equivalent and as practical as the American type. Their design is somewhat cheaper to produce. The California American design is the new modern look in binoculars and rapidly becoming very popular. It also features the advantage of the one piece body housings which are moisture

resistant and dust proof. The French box construction is still popular in the one piece

Figure 1—American Mon-a-block construction. Figure 2—German two-piece construction. Figure 3—French box construction. Figure 4—California style outside body using mon-a-block construction.

body housing with projected objective housing. This type glass is priced in the same range as the German type. Herter's 7x35 wide angle compact is constructed in this design and offers a high quality glass at a moderate price.

Prices listed below on all models of binoculars and monoculars do not include either Federal or State Excise Taxes. The 10% Federal Excise tax was withdrawn June 22, 1965 on these optical items.

**HERTER'S HUDSON BAY 6  
POWER X 15MM OBJECTIVE  
LENS BINOCULARS**

ULTRAVIOLET RAY FILTERED

This compact, lightweight model is excellent for rifle hunters in rough mountain-

**WHAT IS NEW FOR TOMORROW, YOU CAN BUY AT HERTER'S TODAY**

ous or bushy country, for the archer who is concerned with bulk and weight and for duck and goose hunters for following crippled birds.

They are also recommended for all indoor sports, theatrical events, racing and spectator sports. They are used by many professional hunters and guides in North America and foreign countries where bulk and weight are important factors, as this binocular will fit into the palm of your hand, or pocket of your shirt or jacket.

**SPECIFICATIONS:**

## TAPERED CROSS-HAIR RETICLE SUITABLY FINE AT ANY POWER - WITHOUT SACRIFICE OF ACCURACY

The ideal reticle for a variable power scope is the tapered cross-hair which always appears the same size. This form allows the reticle to be placed *ahead* of the power changing lenses so that their movement does not disturb precise zero setting. Also, the arms act as pointers to whip the eye to the center for quick aiming. Against a dark background, when a fine cross-hair would be obscured, the heavier lines at the edge adequately indicate the center point.

All other variable power scope reticles either sacrifice accuracy or lose the advantages of the taper. Since the tapered cross-hair is patented it is exclusive with Bausch & Lomb.

Bausch and Lomb Rifle Scopes and Mounts Offer these Advantages:

- SUPERB OPTICAL PERFORMANCE
- EXTREME RUGGEDNESS
- SCRATCH-PROOF FINISH
- GUARANTEED FOG-PROOF
- ALWAYS STAYS IN ZERO
- INTERCHANGEABLE RIFLE-TO-RIFLE

## Bausch & Lomb Mounts

Low, rugged mounting that practically makes the B&L sight an integral part of the rifle. Extremely fine adjustments for both windage and elevation, the least likely of failure of any method ever offered to the hunter. Easy detachment of the sight from the mount—one sight will serve any number of rifles. And because the mount is zeroed rather than the sight, the zero will be constant regardless of which rifle the sight is on.

**CLAMP RING**, for use with the bases listed below.

## BALVAR 8A, 2½X—8X HUNTING-VARMINT SIGHT

The incomparable BALvar 8... the scope so many have tried to copy. Brilliant engineering fulfilled by experienced craftsmanship. Provides every magnification you need for hunting in the brush, mountains or open plain—and for varmint hunting too. Change it from gun to gun or install it on your favorite "all-purpose" rifle. Continuously variable without change in focus, eyepoint or zero. Exclusive tapered reticle (1/3 minute at center) assures faster, surer aim and has no apparent change in size at any power setting.

## BALTUR A, 2½X

The model most often chosen for woods hunting or whatever conditions limit the shooting distance. Its special features are the very wide field of view, brilliant image, and the extra large exit pupil which allows for difference in head position in snap shooting. A 2½X scope is best for those making the transition to a telescopic sight after long experience with iron sights.

No. F-B614226, ¾ min. Standard Cross-Hair  
retail \$49.95, shp. wt. 2 lbs.... **G.M. PRICE \$38.95**

No. F-B614227, 2 min. Tapered Post  
retail \$49.95, shp. wt. 2 lbs.... **G.M. PRICE \$38.95**

## BALFOR A, 4X

For many years now the 4X scope has held top honors in unit volume for big game hunting. Top honors in performance go to the B&L Balfor A for its excellent optics, image brilliance, dependability and durability and wide field of view. Like all B&L hunting scopes, it is so strongly made that it can be used to drive nails and the finish is file-hard. Here is a scope that will still be in mint condition after years of hard usage.

No. F-B614240, ½ min. Standard Cross-Hair  
retail \$49.95, shp. wt. 2 lbs.... **G.M. PRICE \$38.95**

No. F-B614241, 1½ min. Tapered Post  
retail \$49.95, shp. wt. 2 lbs.... **G.M. PRICE \$38.95**

## BALVAR 5, 2½—5X

A variable-power scope covering the range of magnification most used in big game hunting. Power change is continuous on the zoom principle so the sportsman can select the right amount for the prevailing conditions of weather and terrain. For the man who has a problem in deciding between a 2½X and a 4X, this model is an answer. As power is changed there is no change in zero, focus, eyepoint or in apparent reticle size.

No. F-B614206, 1/3 min. Tapered Cross-Hair, retail \$78.95, shp. wt. 2 lbs..... **G.M. PRICE \$59.95**

The scope prices quoted do not include the clamp ring and bases.

# WEAVER SCOPES and WEAVER MOUNTS

## V8 Variable Power Hunting Scope--2 1/2 X to 8X

Sold complete with Weaver Adjustable-Mount. Mount\*uses standard Weaver-Detachable Top Mount bases.

**POWER CHANGE** **WEAVER-ADJUSTABLE MOUNTS**

The Model V8 Variable Power was developed especially for the shooter wanting one scope for all kinds of hunting and shooting, at short to long ranges. The design, mechanically and optically, results in a strong, dependable scope; many new features include the new V8 Multi-Range Reticle, an improved power change method, and the Weaver-Adjustable Mounts with which the scope is equipped.

\*these target type adjustable-mounts (rings) incorporate knurled knobs, with dust covers, for windage and elevation changes while in the field or on the bench.

- BASE**, Side Mount, Shp. Wt. 4 oz..... **89¢**

Weaver-Detachable Mounts, low, clean-lined and compact have no protruding lugs for clamping screws. The scope and upper mount part can be removed in seconds leaving no obtrusive bases and standby iron sights, if wanted - on the gun. Replacement is accurate and dependable. Weaver Detachable Mounts with split rings, both top and side style are made for 1" diameter scopes. Weaver-Detachable Top Mount Rings, high style, are available in 1" diameter only. The rings position the scope 1/4" higher than the standard 1" ring. They are used with scopes having large diameter objective ends, such as the Model K6 and other scopes with objective diameters greater than 1 1/4". In some mounting situations, where additional height is needed for the scope eyepiece to clear the bolt handle or the objective end to clear the rear sight, these rings provide the needed clearance.
